

Amendments to the Claims

This listing of claims will replace all prior versions, and listing, of claims in the application:

1. (Currently Amended) A method for disabling ~~BIOS-provided~~ console redirection capabilities provided by a basic input and output system (BIOS) in the presence of an incompatible device, the method comprising:

determining whether a communications port has been enabled for utilization with a BIOS-provided console redirection feature;

in response to determining that a communications port has been enabled for console redirection, determining whether a device ~~is~~ connected to the communications port ~~that~~ is incompatible with console redirection; and

in response to determining that an incompatible device is connected to the communications port, disabling the BIOS-provided console redirection feature.

2. (Original) The method of Claim 1, wherein determining whether a communications port has been enabled for utilization with a BIOS-provided console redirection feature comprises reading configuration data stored in a non-volatile memory device to determine whether a communications port has been enabled for utilization with a BIOS-provided console redirection.

3. (Currently Amended) The method of Claim 2, wherein determining whether a device ~~is~~ connected to the communications port ~~that~~ is incompatible with console redirection comprises:

enabling the communications port for communication;

transmitting data on the communications port for reception by the device;

determining whether a receive buffer of the communications port contains data following the transmission of the data on the communications port; and

determining that a the device is connected to the communications port ~~that~~ is incompatible with console redirection in response to determining that the receive buffer contains data following the transmission of the data on the communications port.

4. (Original) The method of Claim 3, wherein the BIOS-provided console redirection feature is implemented by a compressed redirection module and wherein disabling the BIOS-provided console redirection feature comprises not uncompressing or executing the redirection module.

5. (Original) The method of Claim 4, further comprising in response to determining that an incompatible device is not connected to the communications port, enabling the BIOS-provided console redirection feature.

6. (Original) The method of Claim 5, wherein enabling the BIOS-provided console redirection feature comprises decompressing the compressed redirection module and executing the redirection module.

7. (Original) The method of Claim 6, wherein the incompatible device comprises one of a mouse input device, a modem, or a serial loopback device connected to the communications port.

8. (Original) The method of Claim 7, further comprising executing a BIOS power-on self test procedure.

9. (Currently Amended) A ~~computer-readable medium~~ computer storage media having computer-executable instructions stored thereon which, when executed by a computer, cause the computer to perform the method of Claim 1.

10. (Cancelled)

11. (Currently Amended) A method for disabling ~~BIOS-provided~~ basic input and output system (BIOS) provided console redirection capabilities in the presence of a ~~non-UART~~ non universal asynchronous receiver transmitter (UART) device, the method comprising:

determining whether a communications port has been enabled for utilization with a BIOS-provided console redirection feature;

in response to determining that a communications port has been enabled for console redirection, determining whether a non-UART device is connected to the communications port; and

in response to determining that a non-UART device is connected to the communications port, disabling the BIOS-provided console redirection feature.

12. (Original) The method of Claim 11, wherein determining whether a communications port has been enabled for utilization with a BIOS-provided console redirection feature comprises reading configuration data stored in a non-volatile memory device to determine whether a communications port has been enabled for utilization with a BIOS-provided console redirection.

13. (Currently Amended) The method of Claim 12, wherein determining whether a non-UART device is connected to the communications port comprises:

enabling the communications port for communication;

transmitting data on the communications port for reception by a device connected to the communications port;

determining whether a receive buffer of the communications port contains data following the transmission of the data on the communications port; and

determining that a non-UART device is connected to the communications port in response to determining that the receive buffer contains data following the transmission of the data on the communications port.

14. (Original) The method of Claim 13, wherein the BIOS-provided console redirection feature is implemented by a compressed redirection module and wherein disabling the BIOS-provided console redirection feature comprises not uncompressing or executing the redirection module.

15. (Original) The method of Claim 14, further comprising in response to determining that a non-UART device is not connected to the communications port, enabling the BIOS-provided console redirection feature.

16. (Original) The method of Claim 15, wherein enabling the BIOS-provided console redirection feature comprises decompressing the compressed redirection module and executing the redirection module.

17. (Original) The method of Claim 16, wherein the non-UART device comprises one of a mouse input device, a modem, or a serial loopback device connected to the communications port.

18. (Original) The method of Claim 17, further comprising executing a BIOS power-on self test procedure.

19. (Currently Amended) A ~~computer-readable medium~~ computer storage media having computer-executable instructions stored thereon which, when executed by a computer, cause the computer to perform the method of Claim 11.

20. (Cancelled)
